

PATENT
02315-P0028B GSW/DWA

Abstract

A method and apparatus for facilitating the creation of holes in a blow molded container is disclosed generally comprising first and second mold portions mounted adjacent each other along a seam and a mechanism for creating holes at the seam. In some embodiments, first and second punches are used to create one hole underneath the container's handle. In some embodiments, a third mold portion is used to create a rose surface and create a plurality of holes therein.
